Secunia PSI Country Report - Q3 2014

Australia

Secunia
Stay Secure

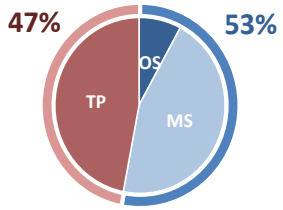
The average PC user in Australia has:

Programs Installed	39% of these programs	61% of these programs	Users with unpatched Operating Systems	Unpatched third-party programs on avg. PC	End-of-Life programs on average PC
80	**31 of 80**	**49 of 80**	**13.7%**	**10.8%**	**5.7%**
from 28 different vendors	are Microsoft programs	are from third-party vendors	Win7, Win8 Windows Vista	Unpatched MS programs: 4.4%	no longer patched by the vendor

Introduction

This report documents the state of security among PC users in Australia, based on data from scans by the Secunia Personal Software Inspector, in Q3 2014. The security of a PC is largely controlled by the number and type of programs installed on it and to what extent these programs are patched. The data reflects the state of Secunia PSI users. It is safe to assume that Secunia PSI users are more secure than other PC users.

Origin of Vulnerabilities



Origin of vulnerabilities
Oct 2013 to Sep 2014

Operating System	8%
Microsoft Prog.	45%
3rd Party Prog. (TP)	**47%**

Cybercriminals know that most private users consider regular security maintenance of their PC hard work. As a result, a lot of users have PCs that are inadequately patched and therefore easily compromised.

On a typical PC, users have to master 28 different update mechanisms to patch the 80 programs on it, in order to remediate vulnerabilities:

• 1 single update mechanism for the 31 Microsoft programs that make up 39% of the programs on the PC.
• Another 27 different update mechanisms to patch the remaining 49 programs (61%) from the 27 so-called third-party vendors whose products are on the PC, and who each have a unique update mechanism.

Top 10 Most Exposed Programs

We have ranked the Top 10 of programs, based on risk exposure. We rank them based on 2 parameters: % market share multiplied by % of unpatched.
That is, how widespread they are multiplied by how many of their users have neglected to patch them, even though a patch is available.
The list at the far right shows how many vulnerabilities were detected for a program in the last four quarters (Oct 2013 to Sep 2014).

	Program	Unpatched	Market share	Vulns
1	Oracle Java JRE 1.7.x / 7.x	42%	61%	145
2	Apple QuickTime 7.x	34%	56%	11
3	VLC Media Player 2.x	43%	44%	2
4	Adobe Reader X 10.x	25%	40%	21
5	Apple iTunes 11.x	17%	52%	26
6	Microsoft Internet Explorer 11.x	10%	76%	218
7	Adobe Shockwave Player 12.x	33%	16%	5
8	Microsoft XML Core Services (MSXML) 6.x	5%	100%	1
9	Microsoft XML Core Services (MSXML) 3.x	5%	100%	2
10	Adobe Reader XI 11.x	13%	35%	22

Vulns indicate number of new vulnerabilities in the last four quarters. Market share is percentage of PSI users who have the program installed on their PC.

What does it mean?

If a vulnerable program remains unpatched on your PC, it means that your PC is vulnerable to being exploited by hackers. So if 43% of PCs running VLC Media Player 2.x, who have a 44% market share, are unpatched, 19% of all PCs are made vulnerable by that program. The same PC can have several other unpatched, vulnerable programs installed.

Top 10 End-of-life (EOL) Programs

End-of-Life (EOL) programs are no longer maintained and supported by the vendor, and do not receive security updates. They are therefore treated as insecure. If you identify and remove End-of-Life programs you have made your PC a great deal more secure!

#	Program	Market share	#	Program	Market share
1	Adobe Flash Player 14.x	77%	6	Google Chrome 35.x	23%
2	Microsoft XML Core Services (MSXML) 4.x	71%	7	Mozilla Firefox 30.x	19%
3	Google Chrome 36.x	45%	8	Adobe AIR 14.x	17%
4	Mozilla Firefox 31.x	28%	9	Adobe AIR 3.x	16%
5	Oracle Java JRE 1.6.x / 6.x	26%	10	Adobe Flash Player 13.x	16%

Disclaimers: The data in this Country Report is a snapshot taken on 2014-09-30. Because Secunia Advisories are updated continuously, as new information becomes available, data in snapshots taken on different dates may vary.
Two different programs can have a shared code base and therefore share a vulnerability. This means that the same vulnerability will appear in 2 different programs. Therefore, when we group products the same vulnerability may be counted twice.

Remark: The percentage of unpatched users for a program/OS is highest shortly after the release of a patch
